

Abstract of the Disclosure

A flow through felt liquid dispensing apparatus for applying liquids to a receiving surface. The dispensing apparatus may include one or more dispensing heads each including a dispensing gun and an articulated rub block. The articulated rub block includes a recess or
5 galley just behind the felt so as to provide a puddle of liquid material for soaking through the felt during a dispensing operation. The apparatus may be tilted so as to present only one dispensing head at a time to the receiving surface. The galley has a geometry to improve the bead profile of the liquid material dispensed onto the surface. Liquid material is dispensed by relative lateral movement between the apparatus and the receiving surface.
